## Relative velocity -

The relative velocity of one object with respect to another is the velocity with which one object moves with respect to another object. When two objects $A$ and $B$ are moving with different velocities, then the velocity of one object $A$ with respect to another object $B$ is called relative velocity of object $A$ with respect to object $B$, hence relative velocity is defined as the time rate of change of relative position of one object with respect to another.

Expression for the relative velocities - Suppose two objects $A$ and $B$ moving with uniform velocities $V_{A}$ and $V_{B}$ respectively along parallel straight line path in the
(i) Same direction (I.e. angle between them is $0^{\circ}$ ) then,

Relative velocity of $A$ with respect to $B=V_{A B}=V_{A}-V_{B}$.

(ii) Opposite direction (I.e. angle between them is $180^{\circ}$ ) then,

Relative velocity of $A$ with respect to $B=V_{A}+V_{B}$.

Relative velocity of $A$ with respect to $B=V_{A}-\left(-V_{B}\right)=V_{A}+V_{B}$

Relative velocity objects $A$ and $B$ when angle between them is $\theta$ - If angle between their velocities are $\theta$ then relative velocity between them can be find with the help of substraction of vectors .

Let angle between $V_{A}$ and $V_{B}$ is $\theta$ (as shown in figure)

Here substraction of vectors (relative velocity) $=\mathrm{V}_{\mathrm{AB}}=\left(\mathrm{V}_{\mathrm{A}}{ }^{2}+\mathrm{V}_{\mathrm{B}}{ }^{2}-2 \mathrm{~V}_{\mathrm{A}} \mathrm{V}_{\mathrm{B}} \cos \theta\right)^{1 / 2}$.
And direction of the relative velocity will be given as

$$
\operatorname{Tan} \beta=\mathrm{V}_{\mathrm{B}} \sin \theta / \mathrm{V}_{\mathrm{A}}-\mathrm{V}_{\mathrm{B}} \cos \theta .
$$
